August 2026

Description: Model validation against ICIMOD's authoritative inventory of 42 potentially dangerous glacial lakes (PDGLs) in the Koshi basin. The independent screening model captured 29 of the 42 recognized PDGLs (69%), including the benchmark Rank-I lakes Imja and Tsho Rolpa — a strong result for a lightweight, three-factor approach (dam type, lake area, and glacier proximity). Lakes flagged by only one method mark where rapid screening and detailed field assessment diverge, making the two complementary tools for GLOF hazard prioritization.
