

Tsho Rolpa Flood Corridor — Downstream Exposure, Koshi Basin

Downstream flow-path analysis of Tsho Rolpa, a Rank-I potentially dangerous glacial lake. Because outburst floods travel far down-valley, exposure extends well beyond the lake itself. Tracing the flood corridor along the Rolwaling Khola into the Tama Kosi, the path threatens 9 settlements and approximately 1,134 residents in the lower valley. This demonstrates that downstream flow-path analysis reveals substantially greater and more concentrated exposure than proximity alone. Corridor shown as a screening buffer along the river network, not modeled inundation.
